Future Plans: As this development of this application is not as far along as was initially proposed, there are many tasks which remain. The primary infrastructure for many user stories is currently in place. This means that while they are immediately usable, they are not complete. These user stories are as follows:

- As a student, I need an application which allows me to search/filter courses based on course number, title, professor, and difficulty.
- As a prospective or incoming student, I need to be able to browse the course catalogue.
- As a student, I need to be able to view my schedule.
- As a user with several devices, I'd like to access my degree plan on several devices.
- As a disorganized person, I need an application that will save my schedule between semesters so I don't lose track of my long term plan.

Following this are the remaining user stories which pertain to those features which were not implemented nor prepared due to time constraints. They are as follows:

- User stories focused on exporting schedules
- User stories focused on visualization preferences
- User stories focused on importing schedules
- User stories notifying users of changes
- User stories regarding rating professors or courses
- User Stories regarding user preferences about course times and difficulties

As well as these, finalized user interfaces need to be designed in order to make the application feel welcoming and natural.

As none of the above features are complete, full fledged testing has yet to occur. Though we are running less formal testing as development continues, we will not complete the testing documented in the TestPlan document until development reaches a more complete phase.
